

# VARIATIONS IN SOFTWARE DEVELOPMENT BY FUNCTION POINT SIZE

Version 3.0 – January, 2018

## Abstract

Building small applications and building large systems are very different. Small software projects of a 100 function points can be built by a few developers and a few other personnel. These are low in risk and usually delivered on time. Large systems in the 10,000 function point size range require many skilled specialists such as business analysts, architects, and data base analysts who may not be needed for small projects. These are extremely risk and almost never on time or within budget. Worse, quality control is often poor so post-release bugs are troublesome for users.

This paper shows typical results for three size ranges: 100, 1,000, and 10,000 function points. The data comes from benchmark studies by the author and colleagues at Namcook Analytics LLC. Our Software Risk Master (SRM) tool was used to provide the quantitative data in the paper and in the following summary table:

### The Impact of Size on Software Project Costs and Schedules

(Assumes IT financial application and Java programming language)

Size in Function Points	Small 100	Medium 1,000	Large 10,000
Size in LOC	5,330	53,300	533,000
Schedule months	5.75	13.80	33.11
Team staff size	1.25	6.50	66.66
Effort months	7.19	89.72	2,207.00
Function points Per month	13.90	11.15	4.53
Costs	\$71,930	\$897,250	\$22,075,000
\$ per function point	\$719.30	\$897.25	\$2,207.50

**Overall risks**                                **7.83%**                                **14.60%**                                **29.22%**

The differences in function point size leads to very different kinds of development practices and to very different productivity rates at the low end compared to the high end. For example for some large systems finding and fixing bugs and creating paper documents cost more than the code itself.

Successful results for large systems requires early sizing and estimating using tools such as Software Risk Master (SRM) and careful progress and cost tracking using tools such as the Automated Project Office (APO).

## Variations in Software Development by Function Point Size

In many industries building large products is not the same as building small products. Consider the differences in specialization and methods required to build a rowboat versus building an 80,000 ton cruise ship.

A rowboat can be constructed by a single individual using only hand tools. But a large modern cruise ship requires more than 350 workers including many specialists such as pipe fitters, electricians, steel workers, painters, and even interior decorators and a few fine artists.

Software follows a similar pattern: Building large systems in the 10,000 to 100,000 function point range is more or less equivalent to building other large structures such as ships, office buildings, or bridges. Many kinds of specialists are utilized and the development activities are quite extensive compared to smaller applications.

Table 1 illustrates the variations in development activities noted for the six size plateaus using the author's 25-activity checklist for development projects:

**Table 1: Development Activities for Six Project Size Plateaus**

	<b>1</b>	<b>10</b>	<b>100</b>	<b>1000</b>	<b>10,000</b>	<b>100,000</b>
	<b>Function</b>	<b>Function</b>	<b>Function</b>	<b>Function</b>	<b>Function</b>	<b>Function</b>
<b>Activities Performed</b>	<b>Point</b>	<b>Points</b>	<b>Points</b>	<b>Points</b>	<b>Points</b>	<b>Points</b>
01 Requirements	X	X	X	X	X	X
02 Prototyping				X	X	X
03 Architecture					X	X
04 Project plans				X	X	X
05 Initial design		X	X	X	X	X
06 Detail design			X	X	X	X
07 Design reviews					X	X
08 Coding	X	X	X	X	X	X
09 Reuse acquisition	X	X	X	X	X	X
10 Package purchase					X	X
11 Code inspections				X	X	X
12 Ind. Verif. & Valid.						
13 Change control				X	X	X
14 Formal integration				X	X	X
15 User documentation			X	X	X	X
16 Unit testing	X	X	X	X	X	X
17 Function testing			X	X	X	X
18 Integration testing				X	X	X
19 System testing				X	X	X
20 Beta testing					X	X
21 Acceptance testing				X	X	X
22 Independent testing						
23 Quality assurance						X

24 Installation/training				X	X	X
25 Project management			X	X	X	X
Activities	4	5	9	18	22	23

Below the plateau of 1000 function points (which is roughly equivalent to 100,000 source code statements in a procedural language such as COBOL) less than half of the 25 activities are normally performed. But large systems in the 10,000 to 100,000 function point range perform more than 20 of these activities.

To illustrate these points table 2 shows quantitative variations in results for three size plateaus, 100, 1,000, and 10,000 function points:

Table 2: Powers of Ten for 100, 1,000, and 10,000 Function Points

<b>Size in Function Points</b>		<b>100</b>	<b>1,000</b>	<b>10,000</b>
<b>Examples</b>		<b>Medium update</b>	<b>Smart Phone app</b>	<b>Local System</b>

<b>TOTAL STAFF</b>	<b>6.37</b>	<b>20.11</b>	<b>148.42</b>

As can be seen from Table 2 what happens for a small project of 100 function points can be very different from what happens for a large system of 10,000 function points. Note the presence of many kinds of software specialists at the large 10,000 function point size and their absence for the smaller sizes. As application size in function points goes up a number of problems get worse:

### **Table 3: Problems of Large Software Applications**

1. Requirements completeness declines
2. Requirements changes increase
3. Document volumes grow rapidly
4. Document completeness declines
5. Defect potentials increase
6. Defect removal efficiency (DRE) declines
7. Numbers of test cases increase
8. Test coverage declines
9. Cyclomatic complexity goes up
10. Risks of cancellation and delays go up alarmingly
11. Function point counting costs go up
12. Many large applications don't use function points

The software industry has done well for small projects but not for large systems. Function point metrics have been widely used for small applications but are seldom used above 10,000 function

points due to the high cost and lengthy time interval required. There are several forms of high-speed function points such as pattern matching for new projects and automated counts for legacy applications, but manual counts by certified function point personnel remain the most common.

### **Summary and Conclusions**

There are major differences in software development methods, software staffing, software quality, and software productivity between small applications of 100 function points and large systems of 10,000 function points or more. Small projects are generally successful and have fairly good quality and productivity. Large systems fail more often than they succeed and seldom have good quality and productivity.
